1 For your Safety

This chapter provides information on the safe handling of DEUBLIN rotating unions.

- For your own safety and the safety of other people read this operating manual carefully and completely prior to working on or with DEUBLIN rotating unions.
- This operating manual exclusively describes the rotating unions of the manufacturer DEUBLIN. In the further description/explanation the name “DEUBLIN” is left out for a better readability.
- This operating manual is a material part of the specified rotating unions. The operator is responsible for the personnel to take note of this manual.
- The operator of the rotating unions shall not make any modifications or attachments to and retrofitting of the rotating union without the manufacturer’s consent.
- Please follow the additional instruction “Installation” for a secure and correct installation of the rotating union. The installation instruction is included with the delivered union.

1.1 Intended Use

The rotating unions of the series 55 “Ultra low torque” supply the feeding of the following media: Water

<table>
<thead>
<tr>
<th>Series</th>
<th>Model</th>

</tr>
</tbody>
</table>

The rotating unions referred to are designed for non-potentially explosive environments and non-combustible media. Details on the operating range of the rotating unions are provided in the catalogue and/or the model-specific installation drawing.

The rotating unions of the series 55 “Ultra low torque” can be used as one-way or two-way version depending on the type of connection.

Note: For the use of other media (e.g. air) individual special models are available to which these operating instructions do not apply. If using other media please contact DEUBLIN.

1.1.1 Application one-way version (Mono)

For the one-way version, models are available which can be installed at the machine shaft from the outside.

Rotating union externally mounted

Fig. 1: Schematic diagram one-way version (Mono – externally mounted)
One one-way version of the rotating union is mounted at each of the two ends of the roller. The rotat-
ing union (A) conveys the medium into the roller. The rotating union (B) conveys the medium into the piping system of the machine.

1.1.2 Application two-way version (Duo)

The rotating unions of the series 55 “Ul-
tra low torque” are also available as two-way model (Duo).

The two-way rotating union is fitted with an axial connection at the elbow. Through this elbow the medium is con-
veyed into the machine shaft through a supply tube.

The return medium is absorbed by the same rotating union and conveyed into the piping system of the machine through the radial connection.

Fig. 2: Schematic diagram two-way version (Duo)

1.2 Misuse

This chapter provides information on known misuse of rotating unions of 55 series. The rotating unions are not suitable for the areas and applications described herein. Use in such ar-
reas or for such applications constitutes a misuse endangering people and machines and is therefore prohibited.

Prohibition for the following areas:

- **Potentially explosive areas**
  The rotating unions of 55 series shall not be used in potentially explosive areas, as they are not approved for the requirements in potentially explosive areas. Operation in such areas may cause explosions.

- **Food**
  Food, cleaning and disinfectant residues cannot be removed from the rotating unions. People may suffer poisoning.

Prohibition for the following applications:

- **Conveying of combustible media or hydrocarbons**
  Combustible media or hydrocarbons may ignite or cause explosions.

- **Connection to a piping system with excessive pressure**
  If excessive pressure is applied to the rotating unions, supply pipes can come off and cause personal injury or property damage.

- **Operation without lubrication**
  Dry operation (without medium) of the rotating union causes damage to the axial face seals.

- **Connection to fixed pipes**
  If connection is via fixed pipes, the rotating unions may leak and the ball bearings may get damaged.

- **Conveying of media which are too hot**
  If the media exceed the maximum admissible temperature for the rotating union, the static seals (elastomeric seals) can be damaged which may result in leaky rotating unions and personal injury or property damage.

- **For series 54 and 57 only: Conveying saturated steam**
  Escaping steam may injure people seriously.

This list is not comprehensive and will be updated with results from product observation.
1.3 Safety Instructions
This chapter provides information on the hazards through rotating unions.

1.3.1 Hazards due to hot surfaces
The rotating unions are heated by the temperature of the medium. Skin contact with heated rotating unions can cause injuries.

- Use safety gloves and PPE (Personal Protective Equipment) protecting against heat when handling the rotating union.
- Attach a clearly visible danger sign visibly on/next to the rotating union in order to warn of danger.

1.3.2 Hazards by improper hoses
For the connection of the rotating union to the machine, you have to choose appropriate hoses for the respective medium, which meet the specifications for the application.
If you use incorrect hoses, they may become porous or burst. This can cause personal injury and/or property damage to components of the machine.

- In case of the media water, use hoses which are suitable for the maximum system pressure of the machine and the maximum temperature of the media.

1.3.3 Hazards due to the media
When working on the rotating union, injuries can be caused by skin or eye contact with the media.

- Observe the safety instructions for the flow media. Observe the COSHH Safety Data Sheet for the flow media.

1.3.4 Hazards by faulty installation
If the rotating unions are installed incorrectly, hoses and connections may become leaky. The medium can escape. Depending on the medium, personal injury or property damage to the components of the machine may occur.

- Before installing the rotating union ensure that no feed pressure and no residual pressure is applied to the pipeline system of the machine.
  - Please follow the additional instruction “Installation” for a secure and correct installation of the rotating union. The installation instruction is included with the delivered union.
- Install the rotating union on the machine using hoses only, in order to avoid stress on the rotating union.
- Install the hoses free from stress.
- Install the rotating union in a way that the leaking medium can be carried away securely downward at the lowest point and that the drain line shows a fall (min. 15°).
- Install the hoses to the rotating union prior to mounting it at the machine shaft.
1.4 Structure of Pictograms

This chapter provides information on the meaning of the pictograms used in the manual.

- **Warning**
  Potentially dangerous situation, which may result in death or serious injury.

- **Note**
  Potentially harmful situation in which the product or surrounding objects can be damaged.

- **Info**
  Application notes and other useful information.

2 Information as to this Manual

The copyright as to this manual remains with **DEUBLIN**. Subject to changes!

- You can download the latest version of this manual under www.deublin.com.
- Always use the latest version of the operating manual.

3 Information on the Name Plate

- **DEUBLIN**
  Model number
  
  DEUBLIN’s internal identification / date of manufacture
  
  MADE IN <<country of manufacture>>

Fig. 3: Name plate

The coding of the model number is described in the catalogue. The model number corresponds to the order number.
4 Information on the Design

This chapter provides information as to which items have to be observed in the design in order to have a positive effect on the service life of the rotating union.

You can obtain the drawings of the rotating unions from DEUBLIN in order to integrate the rotating union in your drawing. You will need the model-specific installation drawing of your rotating unions for a secure set-up and operation of the rotating unions.

The model-specific installation drawing of the respective rotating union contains e.g.:
- torque moments of the union
- technical data
- tolerances
- approved media

4.1 Filtering of the Medium

Unfiltered media with a particle size of more than 60 μm result in increased wear of the rotating union.

The larger the particles in the media, the higher the wear of the rotating union is. The higher the total of all particles (polluting load), the higher the wear is.

- Insert a filter in front of the rotating union which filters particles with a size of 60 μm and larger from the media.

4.2 Connecting Options of the Rotating Union at the Machine Shaft

Fig. 4: Options for the installation on the machine shaft

The rotating unions can be fastened on the machine shaft by screwing (A) or by means of a flange (B) depending on the rotating union.

4.3 Options of Hose Installation

The following examples show how to install the hoses at the rotating unions. These connecting options ensure that the hoses do not transfer stress to the rotating unions when the machine shaft moves.

- Please pay attention to the chapter “1.3 Security Advices” regarding the design.
4.3.1 Connection of hose to the rotating union

The hoses must be installed without stress and bends so that they do not apply any forces to the rotating union. The following figures show examples of installation.

If the rotating unions are installed with connections positioned horizontally, connect the hoses as shown.

![Fig. 5: Connect hoses horizontally](image)

If the hoses are to be guided away from the rotating unions vertically and bent by 90°, connect the hoses as shown.

![Fig. 6: Hoses bent by 90°](image)

4.3.2 Hose connection in case of additional axial movement of the machine shaft

If the rotating unions are installed to machine shafts with an oscillating (axial) movement, the hoses must be stress-free in both extreme positions.

![Fig. 7: Hoses laid in a curve](image)
4.3.3 Hose connection for hoses with SAE flange

Only possible, if the rotating union is ordered with SAE connections.

![Image](image1)

The hoses are fastened at the rotating union by means of its SAE flanges using four screws.

**Fig. 8: Flange connection**

4.3.4 Optional: Connection of a leakage line

Only possible, if the rotating union is externally mounted.

In order to prevent surrounding components from being damaged by escaping medium, you can connect a leakage line to the rotating union, if required.

![Image](image2)

The rotating unions are equipped with leakage holes.

- When used in dirty environment, we recommend to protect the leakage holes against penetrating dirt. You can order sealing plugs at DEUBLIN. If you close the leakage holes, you have to provide the rotating union with ventilation, if applicable by means of a second leakage connection. Without ventilation the leaking medium cannot drain off.

- Position the rotating union in a way that you can always connect the leakage line in 6 o'clock position (at the lowest point) to a leakage hole.

**Fig. 9: Schedule connection of leakage line**
5 Installation

The union installation is described in an additional manual which is supplied with each rotating union. Enclosed you will also find the manual “Installation”. Please follow the additional instruction “Installation” for a secure and correct installation of the rotating union. The instruction “Installation” is available online under www.deublin.com.

- Ensure that the person installing the rotating union receives the following information:
  - Position and location of the rotating union in the machine
  - Plan for connection of hoses
  - Position of leakage line
  - Information on the media
  - Information on the leakage line (optional)
  - model-specific installation drawing

6 Information on the Operation

Damage to components due to missing lubrication (Dry run)
The axial face seals of the rotating unions are lubricated by the medium. If the rotating unions are operated without medium present they are not lubricated and will thus be damaged.

- Ensure that the rotating unions are operated with a lubricating medium.
- Switch off the plant/machine, if the rotating unions are operated without medium.

7 Storage

Damage of component due to incorrect storage
If you store the rotating unions incorrectly, they become leaky or get damaged.

- Store the rotating unions in a dry space between 3 °C and 40 °C.
- Store rotating unions for two years at the most.

8 Maintenance

This chapter provides information on how to extend the service life of the rotating unions by means of maintenance.

8.1 Maintenance Intervals

You can avoid early wear of the rotating unions, if you adhere to the maintenance intervals described herein.

Risk of injury due to hot or cold surfaces
The rotating unions are heated or cooled by the temperature of the medium. Skin contact with these heated or cooled rotating unions can cause severe injuries.

- Before starting to work on the rotating union, allow the machine to cool down.
- Use safety gloves and PPE (Personal Protective Equipment) protecting against heat or cold depending on the application of the rotating unions.
8.2 Daily Inspection

Check the rotating unions for tightness.

Risk of injuries due to applied line pressure

If you have to work on the rotating union and feed pressure of the medium is applied or there is residual pressure in the piping system of the machine, the medium can escape under pressure when releasing the connections. You and other people may suffer severe injuries.

- Ensure that no feed pressure is applied.
- Ensure that there is no residual pressure in the piping system.

During operation of the machine, leakages may occur at the connections and hoses depending on the requirements to the rotating unions.

1. Carry out daily visual inspections in order to check whether leakages occurred at the connections (see arrows).

If you detect leakage:
1. Stop the machine.
2. Replace the defective hoses with new ones.
3. Seal leaking connections.
4. If the rotating union is worn and leaks, replace it with a new one. Repair kits for various models can be obtained from DEUBLIN.

8.3 Maintenance after Operating Hours

This chapter describes how to relubricate the rotating unions.

The maintenance operations described below have to be executed in case of the series 55 “Ultra low torque” only.

The rotating unions are already lubricated in the factory and delivered ready-to-be-installed.

However, before assembly, the packaging such as plastic bags and/or cardboard box should be checked for leaked lubricant oil.

If lubricant oil is found in the packaging, the ball bearings should be relubricated (s. 8.3.1 – 8.3.4).

The indicated volumes of oil and intervals for relubrication are merely based on experience. Oil quantities and intervals can vary according to the conditions of use and must be determined independently according to the relevant case of application.

- In case of doubt, consult DEUBLIN.

Lubricate the ball bearings of the rotating unions at the stated lubricating intervals using the listed volume of oil suitable for the operating conditions. If you do not adhere to these instructions, the service life of the ball bearings is reduced.
8.3.1 Approved oils

</tr>
<tr>
<td></td>
<td>SHELL TELLUS 32</td>
</tr>
<tr>
<td></td>
<td>SHELL TELLUS S2 M 32</td>
</tr>
</tbody>
</table>

8.3.2 Volume of oil for lubrication

**Damage to the component due to excessive oil**
The series „Ultra low torque“ uses oil-bath lubrication. The oil level should thus be just below the centre of the bottom rotating union. If a constant oil level is to be maintained during operation to ensure optimum lubrication the use of adequate lubrication equipment is recommended.

- Filling the ball bearing with too much oil may result in damage to the ball bearings.
- Unless you determined other oil quantities from your application/condition of use DEUBLIN recommends the oil quantities below for relubrication.

**Damage of part due to a too high/low oil viscosity class**
The service life of rotating units is also affected by the lubrication oil film and its actual thickness. The thickness of the lubrication film at the contact surfaces fully bathed in oil is determined by the kinematic viscosity (\( \nu \)), the viscosity index and the pressure viscosity coefficient. Increasing or too low kinematic viscosity will result in an increase of the bearing temperature. Excessive bearing temperatures may result in damage to the ball bearings.

**Component damage due to oil quality loss**
If the rotary unions are supplied with oil for relubrication via, for example, a central lubrication system, this can result in the oil losing the required properties. The bearings of the rotary unions are damaged.

- Ensure that always fresh, clean and new oil is supplied to the bearings.
- Please observe the shelf life indicated by the oil manufacturer.

8.3.3 Relubrication intervals for series 55 „Ultra low torque“
The relubrication intervals depend on the conditions of use of the rotary unions.

Tests under laboratory conditions have shown that no oil is present in the bearing chamber after approximately 36 operating hours at maximum speed (see table below). This indicates that oil is constantly being lost. The operator must therefore ensure that leaking oil is always collected by means of adequate measures. Dispose of the collected oil in accordance with national standards, regulations and guidelines.
For the reasons stated above, the interval after which relubrication is required amounts to 36 operating hours.
The quantities of oil indicated in 8.3.2 are maximum values. Only use these oil quantities if no oil is present in the bearing chamber. Otherwise please only refill the quantity of oil that has leaked out.

#### 8.3.4 Lubricate the rotating union

The following paragraphs describe how to fill the indicated quantity of oil into the ball bearing chamber.

1. Place the filling piece of the oil can on the oiler (see arrow).
2. Ensure that the connector of the oil can is placed correctly on the oiler.
3. Some rotary unions are equipped with a grease nipple. If using these models, remove the grease nipple and reassemble after relubrication has been completed.
4. Fill with pre-determined oil quantity into the ball bearing chamber.
5. Count the operating hours for the following lubrication interval.

#### 9 Trouble Shooting

This chapter provides the following information:

1. Which problem may occur?
2. What can be the cause of the problem?
3. How can you eliminate this problem?

#### 9.1 Potential Causes for Errors and their Elimination

**Risk of injuries due to applied line pressure**

If you have to work on the rotating union and feed pressure of the medium is applied or there is residual pressure in the piping system of the machine, the medium can escape under pressure when releasing the connections. You and other people may suffer serious injuries.

- Ensure that no feed pressure is applied.
- Ensure that there is no residual pressure in the piping system.
### Error Potential causes Elimination

<table>
<thead>
<tr>
<th>Error</th>
<th>Potential causes</th>
<th></th>
</tr>
</thead>
</table>
| Rotating union is leaky after installation | Incorrect installation | 1. Stop the machine.  
2. Ensure that the connections are sealed according to the manual “Installation”.  
3. Ensure that all hoses are installed without stress.  
4. Ensure that all seal faces are clean. |
| Seal faces of the rotating union are damaged | | 1. Pack rotating union.  
2. Send rotating union to **DEUBLIN** for over-haul/service. |
| Rotating union leaks before the end of the expected service life | Medium is contaminated | 1. Stop the machine.  
2. Drain medium.  
3. Send rotating union to **DEUBLIN** for over-haul/service, if required.  
4. Mount new filter.  
5. Flush the piping system of the machine.  
6. Fill in new medium. |
| Rotating union is not designed for the respective application | | 1. Ensure that the correct **DEUBLIN** Rotating Union is used.  
2. Contact **DEUBLIN** if required. |
| Rotating union runs untrue or wobbles | Thread and/or concentricity outside the admissible tolerance. | 1. Stop the machine.  
2. Remove rotating union.  
3. Manufacture new thread or flange.  
4. Install rotating union. |
| Rotating union is mounted incorrectly. | | |

### 9.2 Pack Rotating Union for Transport

The rotating union has to be protected against mechanical impact and humidity during transport to ensure that the rotating union will arrive at **DEUBLIN** without being damaged.

1. Dismount the rotating union in reverse order of the installation (see Installation).  
2. Ensure that the rotating union is free from the respective media.  
3. Use a cardboard box which is suitable for the weight of the rotating union.  
4. Cushion the base of the cardboard box with a soft material, e.g. air bubble film.  
5. Wrap the rotating union with a soft material, e.g. air bubble film.  
6. Ensure that no packing material or dirt can penetrate the opening of the rotating union.  
7. Position the rotating union in the middle of the cardboard box.  
8. Fill the free space around the rotating union with newspaper or another suitable material.  
9. Close the cardboard box by means of tape.
10 Disposal

10.1 Dispose of Packaging

- Dispose of the packaging (cardboard box and plastics) according to the national standards, regulations and directives.

10.2 Dispose of Rotating Union

Mainly, the rotating unions consist of metals, which can be reused within the reclamation of scrap. Decontaminate unions / parts and dispose of in an “Environmentally Friendly” way.

- Dismount the rotating union in reverse order to the installation (see Installation).
- Flush the rotating union.
- Collect the dirty flushing media.
- Dispose of the collected flushing media according to the national standards, regulations and directives.
- Please observe the instructions of the media manufacturer.
- Dispose of the rotating union according to the national standards, regulations and directives.

In case of repair, DEUBLIN disposes of all used parts.

11 Spare Parts

The rotating unions have a limited service life and include wearing parts. Wearing parts are excluded from the warranty. All static and dynamic sealing elements of a component are considered wearing parts, as well as ball bearings. Repair kits are available for several models of the rotating unions and can be obtained from DEUBLIN. Please ask your DEUBLIN Service.

You need special tools and repair instructions for repair of the rotating unions which can be obtained from DEUBLIN as well.

Note

If you do not want to repair your rotating union on your own, DEUBLIN will be pleased to help you. If requested, DEUBLIN will exchange all wearing parts and clean all components of the rotating union. Before repaired rotating unions leave the premises, they will be subjected to an operational check. The repaired rotating union is returned with a standard “DEUBLIN Warranty” valid for 12 months.
Reliability

Many years’ experience, ongoing liaison with customers, innovations sourced inhouse and from suppliers place DEUBLIN in a position providing reliable Rotating Unions at the highest level.

When it comes to concrete applications, maximum service life is guaranteed by matching the sealing to the respective medium.

The service life is also equally maximized by maintaining cleanliness when storing and handling the Rotating Union and by adhering to the guidelines issued by DEUBLIN in respect of the conditions on the customer’s premises.
